| **Performance Expectation MS-LS2-2**  
*Construct an explanation that predicts patterns of interactions among organisms across multiple ecosystems*  
Clarification Statement: Emphasis is on predicting consistent patterns of interactions in different ecosystems in terms of the relationships among and between organisms and abiotic components of ecosystems. Examples of types of interactions could include competitive, predatory, and mutually beneficial. | **Performance Expectation MS-LS2-3**  
*Develop a model to describe the cycling of matter and flow of energy among living and non-living parts of an ecosystem.*  
Clarification Statement: Emphasis is on describing the conservation of matter and flow of energy into and out of various ecosystems and on defining the boundaries of the system.  
Assessment Boundary: Assessment does not include the use of chemical reactions to describe the processes. | **Performance Expectation MS-LS2-1**  
*Analyze and interpret data to provide evidence for the effects of resources availability on organisms and populations of organisms in an ecosystem.*  
Clarification Statement: Emphasis is on cause and effect relationships between resources and the growth of individual organisms and the numbers of organisms in ecosystems during periods of abundant and scarce resources.  
Assessment Boundary: Assessment does not include the use of intermolecular forces. | **Performance Expectation MS-LS2-4**  
*Construct an argument supported by empirical evidence that changes to physical or biological components of an ecosystem affect populations.*  
Clarification Statement: Emphasis is on recognizing patterns in data and making warranted inferences about changes in populations and on evaluating empirical evidence supporting arguments about changes to ecosystems.  
Assessment Boundary: Assessment does not include the identification and naming of minerals. | **Performance Expectation MS-LS2-5**  
*Evaluate competing design solutions for maintaining biodiversity and ecosystems services.*  
Clarification Statement: Examples of ecosystem services could include water purification, nutrient recycling, and prevention of soil erosion. Examples of design solution constraints could include scientific, economic, and social considerations.  
*This performance expectation integrates traditional science content with engineering through a practice or disciplinary core idea.* |

**Performance Expectation MS-ESS3-4**  
*Construct an argument supported by evidence for how increases in human population and per-capita consumption of natural resources impact Earth’s systems.*  
Clarification Statement: Examples of evidence include grade-appropriate databases on human populations and the rates of consumption of food and natural resources (such as freshwater, mineral, and energy). Examples of impacts can include changes to the appearance, composition, and structure of Earth’s systems as well as the rates at which they change. The consequences of increases in human populations and consumption of natural resources are described by science, but science does not make the decisions for the actions society takes. | **Performance Expectation MS-ESS3-2**  
*Develop and use a model to describe how the total number of atoms does not change in a chemical reaction and thus mass is conserved.*  
Clarification Statement: Emphasis is on law of conservation of matter and on physical models or drawings, including digital forms that represent atoms.  
Assessment Boundary: Assessment does not include the use of atomic masses, balancing symbolic equations, or intermolecular forces. | **Performance Expectation MS-ESS3-4**

Clarification Statement: Emphasis is on cause and effect relationships between resources and the growth of individual organisms and the numbers of organisms in ecosystems during periods of abundant and scarce resources.  
Assessment Boundary: Assessment does not include the identification and naming of minerals. | **Performance Expectation MS-ESS3-3**  
*Apply scientific principles to design a method for monitoring and minimizing a human impact on the environment.*  
Clarification Statement: Examples of the design process include examining human environmental impacts, assessing the kinds of solutions that are feasible, and designing and evaluating solutions that could reduce that impact. Examples of human impacts can include water usage (such as the withdrawal of water from streams and aquifers or the construction of dams and levees), land usage (such as urban development, agriculture, or the removal of wetlands), and pollution (such as of the air, water, or land).  
*This performance expectation integrates traditional science content with engineering through a practice or disciplinary core idea.* |

**Performance Expectation MS-ESS2-1**  
*Develop a model to describe the cycling of Earth’s materials and the flow of energy that drives this process.*  
Clarification Statement: Emphasis is on the processes of melting, crystallization, weathering, deformation, and sedimentation, which act together to form minerals and rocks through the cycling of Earth’s materials.  
Assessment Boundary: Assessment does not include the identification and naming of minerals. | **Performance Expectation MS-ESS2-2**  
*Develop a model to describe the cycling of Earth’s materials and the flow of energy that drives this process.*

MS LS2: Ecosystems: Interactions, Energy, and Dynamics
LS2.A: Interdependent Relationships in Ecosystems

Predatory interactions may reduce the number of organisms or eliminate whole populations of organisms. Mutually beneficial interactions, in contrast, may become so interdependent that each organism requires the other for survival. Although the species involved in these competitive, predatory, and mutually beneficial interactions vary across ecosystems, the patterns of interactions of organisms with their environments, both living and nonliving, are shared. (MS-LS2-2)

MS LS2: Ecosystems: Interactions, Energy, and Dynamics
LS2.B: Cycle of Matter and Energy Transfer in Ecosystems

Food webs are models that demonstrate how matter and energy are transferred between producers, consumers, and decomposers as the three groups interact within an ecosystem. Transfers of matter into and out of the physical environment occur at every level. Decomposers recycle nutrients from dead plant or animal matter back to the soil in terrestrial environments or to the water in aquatic environments. The atoms that make up the organisms in an ecosystem are cycled repeatedly between the living and non-living parts of the ecosystem. (MS-LS2-3)

MS LS2: Ecosystems: Interactions, Energy, and Dynamics
LS2.A: Interdependent Relationships in Ecosystems

Organisms, and populations of organisms, are dependent on their environmental interactions both with other living things and with non-living factors. (MS-LS2-1)

MS LS2: Ecosystems: Interactions, Energy, and Dynamics
LS2.B: Cycle of Matter and Energy Transfer in Ecosystems

In any ecosystem, organisms and populations with similar requirements for food, water, oxygen, or other resources may compete with each other for limited resources, access to which consequently constrains their growth and reproduction. (MS-LS2-2)

MS LS2: Ecosystems: Interactions, Energy, and Dynamics
LS2.A: Interdependent Relationships in Ecosystems

In any ecosystem, organisms and populations with similar requirements for food, water, oxygen, or other resources may compete with each other for limited resources, access to which consequently constrains their growth and reproduction. (MS-LS2-2)

MS LS2: Ecosystems: Interactions, Energy, and Dynamics
LS2.C: Ecosystem Dynamics, Functioning, and Resilience

Ecosystems are dynamic in nature; their characteristics can vary over time. Disruptions to any physical or biological component of an ecosystem can lead to shifts in all its populations. (MS-LS2-4)

Five Tools and Processes for NGSS

Tool 1

Technologies involved are engineered otherwise.

Consumption of natural resources increase, so do the negative impacts of Earth, unless the activities and technologies involved are engineered otherwise. (connection DCI to MS-LS2-1, MS-LS2-4 and MS-LS2-5)

Typically as human populations and per-capita consumption of natural resources increase, so do the negative impacts on Earth, unless the activities and technologies involved are engineered otherwise. (connection DCI to MS-LS2-1, MS-LS2-4 and MS-LS2-5)

Biodiversity describes the variety of species found in Earth’s terrestrial and oceanic ecosystems. The completeness or integrity of an ecosystem’s biodiversity is often used as a measure of its health. (MS-LS2-5)

Typically as human populations and per-capita consumption of natural resources increase, so do the negative impacts on Earth, unless the activities and technologies involved are engineered otherwise. (connection DCI to MS-LS2-1, MS-LS2-4 and MS-LS2-5)

Changes in biodiversity can influence humans’ resources, such as food, energy, and medicines, as well as ecosystem services that humans rely on—for example, water purification and recycling. (MS-LS2-5)

Typically as human populations and per-capita consumption of natural resources increase, so do the negative impacts on Earth, unless the activities and technologies involved are engineered otherwise. (connection DCI to MS-LS2-1, MS-LS2-4 and MS-LS2-5)

Human activities have significantly altered the biosphere, sometimes damaging or destroying natural habitats and causing the extinction of other species. But changes to Earth’s environments can have different impacts (negative and positive) for different living things. (connection DCI to MS-LS2-1 and MS-LS2-4)
## Instructional Sequence 1
### Science and Engineering Practices
**Constructing Explanations and Designing Solutions**

Constructing explanations and designing solutions in 6-8 builds on K-5 experiences and progresses to include constructing explanations and designing solutions supported by multiple sources of evidence consistent with scientific ideas, principles, and theories.

**Construct an explanation that includes qualitative or quantitative relationships between variables that predict phenomena.** (MS-LS2-2)

### Science and Engineering Practices
**Developing and Using Models**

Modeling in 6-8 builds on K-5 experiences and progresses to developing, using, and revising models to describe, test, and predict more abstract phenomena and design systems.

**Develop a model to describe phenomena.** (MS-LS2-3)

## Instructional Sequence 2
### Science and Engineering Practices
**Analyzing and Interpreting Data**

Analyzing data in 6-8 builds on K-5 experiences and progresses to extending quantitative analysis to investigations, distinguishing between correlation and causation, and basic statistical techniques of data and error analysis.

**Analyze and interpret data to provide evidence for phenomena.** (MS-LS2-1)

## Instructional Sequence 3
### Science and Engineering Practices
**Analyzing and Interpreting Data**

Analyzing data in 6-8 builds on K-5 experiences and progresses to extending quantitative analysis to investigations, distinguishing between correlation and causation, and basic statistical techniques of data and error analysis.

**Analyze and interpret data to provide evidence for phenomena.** (MS-LS2-1)

## Instructional Sequence 4
### Science and Engineering Practices
**Engaging in Argument from Evidence**

Engaging in argument from evidence in 6-8 builds on K-5 experiences and progresses to constructing a convincing argument that supports or refutes claims for either explanations or solutions about the natural and designed worlds.

**Construct an oral and written argument supported by empirical evidence and scientific reasoning to support or refute an explanation or a model for a phenomenon or a solution to a problem.** (MS-LS2-4)

### Science and Engineering Practices
**Developing and Using Models**

Modeling in 6-8 builds on K-5 experiences and progresses to developing, using, and revising models to describe, test, and predict more abstract phenomena and design systems.

**Develop a model to describe mechanisms.** (MS-PS1-5)

## Instructional Sequence 5
### Science and Engineering Practices
**Engaging in Argument from Evidence**

Engaging in argument from evidence in 6-8 builds on K-5 experiences and progresses to constructing a convincing argument that supports or refutes claims for either explanations or solutions about the natural and designed worlds.

**Evaluate competing design solutions based on jointly developed and agreed-upon design criteria.** (MS-LS2-5)

### Science and Engineering Practices
**Developing and Using Models**

Modeling in 6-8 builds on K-5 experiences and progresses to developing, using, and revising models to describe, test, and predict more abstract phenomena and design systems.

**Develop a model to describe unobservable systems.** (MS-PS1-4)

### Science and Engineering Practices
**Analyzing and Interpreting Data**

Analyzing data in 6-8 builds on K-5 experiences and progresses to extending quantitative analysis to investigations, distinguishing between correlation and causation, and basic statistical techniques of data and error analysis.

**Analyze and interpret data to provide evidence for phenomena.** (MS-LS2-1)

### Science and Engineering Practices
**Constructing Explanations and Designing Solutions**

Constructing explanations and designing solutions in 6-8 builds on K-5 experiences and progresses to include constructing explanations and designing solutions supported by multiple sources of evidence consistent with scientific ideas, principles, and theories.

**Apply scientific principles to design an object, tool, process or system.** (MS-ESS3-3)

</tbody>
</table>

### Big Ideas Sequence 1

- Students develop food webs to show the patterns of interactions in ecosystems. They construct explanations about community relationships such as predation, competition and symbiosis. They engage in argument about the impact of humans on ecosystems.

### Big Ideas Sequence 2

- Students develop and use models of ecosystems to describe the transfer of energy and cycling of matter.

### Big Ideas Sequence 3

- Students analyze and interpret data to explain the effect of limited resources on organisms and populations. They engage in argument about the impact of humans on populations in ecosystems.

### Big Ideas Sequence 4

- Students analyze and interpret data to explore the impact of introducing a new species into an ecosystem and engage in argument about the positive and negative impact of the invasive species on the stability of the ecosystem.

### Big Ideas Sequence 5

- Students design a process for reducing the impact humans have caused on the environment. Using criteria for sustainability, they evaluate different solutions to environmental problems.
