You have learned about animals by reading the article, "Who Wants a Spiny Snack?" and by exploring the Life at the Limits exhibition.

Now you will write a book to teach your friends about these animals.

Your book will include three animals. The first animal will be the spiny pufferfish. The other two animals will be from the Life at the Limits exhibition.

For each animal, name one body part that helps this animal. Then explain in your own words how this body part works. Include a drawing of each animal and label the body part that you have described.

The animal's have different adaptations. An adaptation is a body part that helps the animal survive. The first animal is a Pufferfish. When a
Puffer fish sees a predator. It sucks up water and spines scare the predator away. The next animal is an hercules beetle. The hercules beetle has a hard shell called elytra. It keeps the wings safe under its shell. The last animal is a black-
Swallowfish. It has a elastic stomach. It stretches out his stomach. The stomach is stretchy out because he eats much more bigger animal's. My favorite animal is the Puffer fish because I like his adaptation.
