**Five Tools and Processes for NGSS**

**Tool 2**

- **Performance Expectation MS-ESS3-4**
  - Construct an argument supported by evidence for how increases in human population and per-capita consumption of natural resources impact Earth’s systems.
  - Clarification Statement: Examples of evidence include grade-appropriate databases on human populations and the rates of consumption of food and natural resources (such as freshwater, mineral, and energy). Examples of impacts can include changes to the appearance, composition, and structure of Earth’s systems as well as the rates at which they change. The consequences of increases in human populations and consumption of natural resources are described by science, but science does not make the decisions for the actions society takes.

- **Performance Expectation MS-ESS3-3**
  - Apply scientific principles to design a method for monitoring and minimizing a human impact on the environment.
  - Clarification Statement: Examples of the design process include examining human environmental impacts, assessing the kinds of solutions that are feasible, and designing and evaluating solutions that could reduce that impact. Examples of human impacts can include water usage (such as the withdrawal of water from streams and aquifers or the construction of dams and levees), land usage (such as urban development, agriculture, or the removal of wetlands), and pollution (such as of the air, water, or land).

- **Performance Expectation MS-ESS3-2**
  - Construct an argument supported by evidence for how increases in human population and per-capita consumption of natural resources impact Earth’s systems.
  - Clarification Statement: Examples of evidence include grade-appropriate databases on human populations and the rates of consumption of food and natural resources (such as freshwater, mineral, and energy). Examples of impacts can include changes to the appearance, composition, and structure of Earth’s systems as well as the rates at which they change. The consequences of increases in human populations and consumption of natural resources are described by science, but science does not make the decisions for the actions society takes.

- **Performance Expectation MS-ESS2-1**
  - Construct an argument supported by evidence for how increases in human population and per-capita consumption of natural resources impact Earth’s systems.
  - Clarification Statement: Examples of evidence include grade-appropriate databases on human populations and the rates of consumption of food and natural resources (such as freshwater, mineral, and energy). Examples of impacts can include changes to the appearance, composition, and structure of Earth’s systems as well as the rates at which they change. The consequences of increases in human populations and consumption of natural resources are described by science, but science does not make the decisions for the actions society takes.

- **Performance Expectation MS-ESS2-4**
  - Construct an argument supported by evidence for how increases in human population and per-capita consumption of natural resources impact Earth’s systems.
  - Clarification Statement: Examples of evidence include grade-appropriate databases on human populations and the rates of consumption of food and natural resources (such as freshwater, mineral, and energy). Examples of impacts can include changes to the appearance, composition, and structure of Earth’s systems as well as the rates at which they change. The consequences of increases in human populations and consumption of natural resources are described by science, but science does not make the decisions for the actions society takes.

### Instructional Sequence 1

**MS LS2: Ecosystems: Interactions, Energy, and Dynamics**

**LS2.A: Interdependent Relationships in Ecosystems**

Predatory interactions may reduce the number of organisms or eliminate whole populations of organisms. Mutually beneficial interactions, in contrast, may become so interdependent that each organism requires the other for survival. Although the species involved in these competitive, predatory, and mutually beneficial interactions vary across ecosystems, the patterns of interactions of organisms with their environments, both living and nonliving, are shared. (MS-LS2-2)

### Instructional Sequence 2

**MS LS5: Earth and Human Activity**

**ESS3.C: Human Impacts on Earth Systems**

Typically as human populations and per-capita consumption of natural resources increase, so do the negative impacts on Earth, unless the activities and technologies involved are engineered otherwise. (connection DCI to MS-LS2-1, MS-LS2-4 and MS-LS2-5)

### Instructional Sequence 3

**MS LS2: Ecosystems: Interactions, Energy, and Dynamics**

**LS2.B: Cycle of Matter and Energy Transfer in Ecosystems**

Food webs are models that demonstrate how matter and energy are transferred between producers, consumers, and decomposers as the three groups interact within an ecosystem. Transfers of matter into and out of the physical environment occur at every level. Decomposers recycle nutrients from dead plant or animal matter back to the soil in terrestrial environments or to the water in aquatic environments. The atoms that make up the organisms in an ecosystem are cycled repeatedly between the living and non-living parts of the ecosystem. (MS-LS2-3)

### Instructional Sequence 4

**MS LS2: Ecosystems: Interactions, Energy, and Dynamics**

**LS2.A: Interdependent Relationships in Ecosystems**

Organisms, and populations of organisms, are dependent on their environmental interactions both with other living things and with non-living factors. (MS-LS2-1)

### Instructional Sequence 5

**MS LS2: Ecosystems: Interactions, Energy, and Dynamics**

**LS2.C: Ecosystem Dynamics, Functioning, and Resilience**

Ecosystems are dynamic in nature; their characteristics can vary over time. Disruptions to any physical or biological component of an ecosystem can lead to shifts in all its populations. (MS-LS2-4)

---

**Five Tools and Processes for NGSS Tool 2**

Biodiversity describes the variety of species found in Earth’s terrestrial and oceanic ecosystems. The completeness or integrity of an ecosystem’s biodiversity is often used as a measure of its health. (MS-LS2-5)

| **Science and Engineering Practices**  
Constructing Explanations and Designing Solutions  
Constructing explanations and design solutions in 6-8 builds on K-5 experiences and progresses to constructing explanations and design solutions supported by multiple sources of evidence consistent with scientific ideas, principles, and theories.  
**Construct an oral or written argument supported by empirical evidence and scientific reasoning to support or refute an explanation or a model for a phenomenon or a solution to a problem. (MS-ESS3-4)**  
**Tool 2**  
**Develop a model to describe phenomena. (MS-LS2-3)** | **Science and Engineering Practices**  
Developing and Using Models  
Modeling in 6-8 builds on K-5 experiences and progresses to developing, using, and revising models to describe, test, and predict more abstract phenomena and design systems.  
**Develop a model to describe phenomena. (MS-LS2-2)** | **Science and Engineering Practices**  
Analyzing and Interpreting Data  
Analyzing data in 6-8 builds on K-5 experiences and progresses to extending quantitative analysis to investigations, distinguishing between correlation and causation, and basic statistical techniques of data and error analysis.  
**Analyze and interpret data to provide evidence for phenomena. (MS-LS2-1)** | **Science and Engineering Practices**  
Engaging in Argument from Evidence  
Engaging in argument from evidence in 6-8 builds on K-5 experiences and progresses to constructing a convincing argument that supports or refutes claims for either explanations or solutions about the natural and designed worlds.  
**Construct an oral or written argument supported by empirical evidence and scientific reasoning to support or refute an explanation or a model for a phenomenon or a solution to a problem. (MS-LS2-4)** | **Science and Engineering Practices**  
Engaging in Argument from Evidence  
Engaging in argument from evidence in 6-8 builds on K-5 experiences and progresses to constructing a convincing argument that supports or refutes claims for either explanations or solutions about the natural and designed worlds.  
**Evaluate competing design solutions based on jointly developed and agreed-upon design criteria. (MS-LS2-5)** |

Five Tools and Processes for NGSS

Tool 2
### Crosscutting Concepts and Big Ideas

**Crosscutting Concepts Patterns**
- Patterns can be used to identify cause and effect relationships. (MS-ESS2-2)

**Crosscutting Concepts Cause and Effect**
- Cause and effect relationships may be used to predict phenomena in natural or designed systems. (MS-LS2-3)

**Connections of Nature of Science**
- Patterns can be used to identify cause and effect relationships. (MS-ESS2-3)
- Cause and effect relationships may be used to predict phenomena in natural or designed systems. (MS-ESS3-4)

**Connections to Engineering, Technology and Applications of Science**
- Students develop and use models of ecosystems to describe the transfer of energy and cycling of matter.
- Students analyze and interpret data to explore the impact of introducing a new species into an ecosystem and engage in argument about the positive and negative impact of the invasive species on the stability of the ecosystem.

**Connections to Nature of Science**
- Explanations of stability and change in natural or designed systems can be constructed by examining the changes over time and processes at different scales, including the atomic scale. (MS-ESS2-1)
- Scientific knowledge can describe the consequences of actions but does not necessarily prescribe the decisions that society takes. (MS-ESS3-4)

**Connections to Engineering, Technology and Applications of Science**
- Scientific Knowledge Assumes an Order and Consistency in Natural Systems
- All human activity draws on natural resources and has both short- and long-term consequences, positive as well as negative, for the health of people and the natural environment. (MS-ESS3-4)
- All human activity draws on natural resources and has both short- and long-term consequences, positive as well as negative, for the health of people and the natural environment. (MS-ESS3-4)

**Connections to Nature of Science**
- Science assumes that objects and events in natural systems occur in consistent patterns that are understandable through measurement and observation. (MS-LS2-3)
- Science addresses questions about the natural and material world. (MS-ESS2-1)

**Connections to Engineering, Technology and Applications of Science**
- Influence of Science, Engineering, and Technology on Society and the Natural World
- The use of technologies and any limitations on their use are driven by individual or societal needs, desires, and values; and by differences in such factors as climate, natural resources, and economic conditions. Thus, technology use varies from region to region and over time. (MS-LS2-5) (MS-ESS3-3)

---

**Energy and Matter**
- The transfer of energy can be tracked as energy flows through a natural system. (MS-LS2-3)
- Matter is conserved because atoms are conserved in physical and chemical processes. (MS-PS1-5)
- Explanations of stability and change in natural or designed systems can be constructed by examining the changes over time and processes at different scales, including the atomic scale. (MS-ESS2-1)
- Scientific knowledge can describe the consequences of actions but does not necessarily prescribe the decisions that society takes. (MS-ESS3-4)

**Influence of Science, Engineering, and Technology on Society and the Natural World**
- The use of technologies and any limitations on their use are driven by individual or societal needs, desires, and values; and by differences in such factors as climate, natural resources, and economic conditions. Thus, technology use varies from region to region and over time. (MS-LS2-5) (MS-ESS3-3)

**Influence of Science, Engineering, and Technology on Society and the Natural World**
- All human activity draws on natural resources and has both short- and long-term consequences, positive as well as negative, for the health of people and the natural environment. (MS-ESS3-4)

General Features of the Practices
Adapted from the NGSS Evidence Statements

Some bullets may be added when necessary (e.g., for refining an explanation). Under each category, bullets should be contextualized under a stem. For example, “Communication includes:”

**Asking Questions:**
- Addressing phenomena of the natural world or scientific theories
- Empirical testability

**Defining Problems:**
- Identifying the problem to be solved
- Defining the process or system boundaries, and the components of the process or system
- Defining the criteria and constraints

**Developing and Using Models:**
- Components of the model: Models includes specific variables or factors within the system under study.
- Relationships: Models need to represent the relationship among components in order to provide an account of why the phenomenon occurs.
- Connections: Models needs to be connected to causal phenomena or scientific theory that students are expected to explain or predict.

**Planning and Carrying Out Investigations:**
- Identification of the question to be answered or phenomenon to be investigated
- Evidence to answer this question [including a description of how the evidence collected will be relevant to determining]
- Planning for the Investigation
- Collection of the data
- Refinement of the design

**Analyzing and interpreting data:**
- Organizing data: using graphical display (e.g., table, chart, or graph)
- Identification of relationships: describing observations that show a connection or relationship within a set of data.
- Interpreting data: making a statement to make a claim using the pattern -- showing “what does the pattern really mean”

**Using Mathematics and Computational Thinking:**
- Representation
- Mathematical/Computational Modeling – can be used for prediction
- Analysis – includes computational thinking
Constructing Explanations:
- Explanation of phenomena
- Evidence: scientific data that supports the student’s claim. This data can come from an investigation that students complete or from another source, such as observations, reading material, archived data, or other sources of information. The data needs to be both appropriate and sufficient to support the claim.
- Reasoning: Using the evidence to construct the explanation:
  - a justification that shows why the data counts as evidence to support the claim and includes appropriate scientific principles. The reasoning ties in the scientific background knowledge or scientific theory that justifies making the claim and choosing the appropriate evidence.
- Revision (as necessary)

Designing Solutions:
- Designing Solutions - uses scientific information to generate a number of possible solutions
- Description of criteria and constraints, including quantification when appropriate
- Evaluating potential solutions
- Refining and/or optimizing the design solution

Engaging in Argument from Evidence
- Supported claims: any ideas or designs that students are supporting
- Identifying scientific evidence: identification of multiple lines of scientific evidence that is relevant to a particular scientific question or engineering design problem.
- Evaluation and critique: Identification of strength of the evidence used to support an argument or a particular design solution
- Reasoning and Synthesis: synthesizing the evidence logically and connecting to phenomena

Evaluation template (the evaluation will require that the student brings content knowledge to bear in order to evaluate the claims and evidence presented in the given document being evaluated.)
- Identifying the claims, scientific evidence, and reasoning behind the explanation(s)
- Identifying additional evidence that is relevant to the evaluation.
- Evaluation and critique: identification of strength of the evidence and reasoning used to support a claim or explanation
- Reasoning and Synthesis: synthesizing the evidence logically and connecting to phenomena

Obtaining, Evaluating, and Communicating Information:
- Obtaining
- Evaluating
- Communicating
  - Communication style and format
  - Connecting the DCI and the CCC
Evidence of Learning Specifications
Initial example

Construct an explanation that:

1. shows patterns of interactions between living and non-living parts of ecosystems
2. includes different types of interactions among organisms
### Tool 2 Template Example – Evidence of Learning Specifications

| **Construct an argument supported by evidence for how increases in human population and per-capita consumption of natural resources impact Earth’s systems.** |
| **Clarification Statement:** Examples of evidence include grade-appropriate databases on human populations and the rates of consumption of food and natural resources (such as freshwater, mineral, and energy). Examples of impacts can include changes to the appearance, composition, and structure of Earth’s systems as well as the rates at which they change. The consequences of increases in human populations and consumption of natural resources are described by science, but science does not make the decisions for the actions society takes. |

#### Evidence of Learning Specifications

Construct an explanation that predicts:

1. consistent patterns of interactions between living and non-living parts of ecosystems
2. consistent patterns of types of interactions including competitive, predatory, and mutually beneficial

Construct an argument that:

1. is supported by empirical evidence of interactions within the ecosystem (a type of Earth system) and scientific reasoning
2. supports or refutes how increases in human population cause negative impacts on the Earth
Guide to Developing Evidence of Learning Specifications

Example from MSLS2 Instructional Sequence 1

Construct an explanation that predicts:
1. consistent patterns of interactions between living and non-living parts of ecosystems
2. consistent patterns of types of interactions including competitive, predatory, and mutually beneficial

Construct an argument that:
1. is supported by evidence of interactions within the ecosystem (a type of Earth system) and scientific reasoning
2. supports or refutes how increases in human population cause negative impacts on the Earth

Part 1: Review Your Tool 1 Unit Blueprint

• What will students know and be able to do at the end of the entire unit?
• Select the instructional sequence that will be the focus of your Tool 2 work.

Part 2: Determine the number of sets of Evidence of Learning Specifications you'll need to develop

• Rule of thumb:
  o If you included one PE in your sequence, then you will develop one set of EoL Specs
  o If you included two or more bundled PEs in your sequence
    ▪ If all bundled PEs involve the same SEP, then you will develop one set of EoL Specs.
    ▪ If bundled PEs involve different SEPs, then you will develop multiple sets of EoL Specs.

• Create a foreground/background chart for each set of EoL Specifications you will write
  o Tape PE cards to the top of the chart.
  o Identify the SEP that will be the basis of the sentence stem for the EoL Specifications and record it in the appropriate space on the chart.
  o Review the Assessment Boundary for each PE to identify what will NOT be assessed. Record these ideas in the appropriate space on the chart.
Part 3: Determine the SEPs, CCCs, DCIs, and Connections that will be in the foreground or background

- Write your ideas on the appropriate color sticky note (orange = DCI, blue = SEP, green = CCC, purple = Connection)
- Post your sticky notes on the chart and negotiate with your group which ideas should be in the foreground for achieving the PE and which ideas should be in the background.

Part 4: Brainstorm Evidence of Learning Specifications

- Determine the sentence stem that focuses on the practice through which students will demonstrate their learning
- Brainstorm EoL Specs for the assessment task based on “foreground” ideas.
- Clump EoL Specs if possible.

Part 5: Finalize the Evidence of Learning Specifications

- Color-code each specification to the three dimensions.
- Refine the specifications by re-visiting the precise language in the DCIs, CCCs, PEs.
- Refine the SEP sentence stem using the General Features of the Practices handout.
- Revise specifications to make sure that the complete sentence for each specification includes at least 2 dimensions (DCI, SEP, CCC).

Part 6: Reflect on the Process

- What did you learn through the development of Evidence of Learning Specifications?
