**Disciplinary Core Idea**

**MS.ESS3.B: Natural Hazards**

Mapping the history of natural hazards in a region, combined with an understanding of related geologic forces can help forecast the locations and likelihoods of future events. (MS-ESS3-2)

**Disciplinary Core Idea**

**MS.ESS3.C: Human Impacts on Earth Systems**

Human activities have significantly altered the biosphere, sometimes damaging or destroying natural habitats and causing the extinction of other species. But changes to Earth’s environments can have different impacts (negative and positive) for different living things. (MS-ESS3-3)

**Disciplinary Core Idea**

**MS.ESS3.C: Human Impacts on Earth Systems**

Typically as human populations and per-capita consumption of natural resources increase, so do the negative impacts on Earth unless the activities and technologies involved are engineered otherwise. (MS-ESS3-3), (MS-ESS3-4)
**MS.PS3.A: Definitions of Energy**

A system of objects may also contain stored (potential) energy, depending on their relative positions. (MS-PS3-2)

**MS.PS3.C: Relationship Between Energy and Forces**

When two objects interact, each one exerts a force on the other that can cause energy to be transferred to or from the object. (MS-PS3-2)

**MS.LS2.A: Interdependent Relationships in Ecosystems**

Organisms, and populations of organisms, are dependent on their environmental interactions both with other living things and with non-living factors. (MS-LS2-1)
In any ecosystem, organisms and populations with similar requirements for food, water, oxygen, or other resources may compete with each other for limited resources, access to which consequently constrains their growth and reproduction. (MS-LS2-1)

Growth of organisms and population increases are limited by access to resources. (MS-LS2-1)

Similarly, predatory interactions may reduce the number of organisms or eliminate whole populations of organisms. Mutually beneficial interactions, in contrast, may become so interdependent that each organism requires the other for survival. Although the species involved in these competitive, predatory, and mutually beneficial interactions vary across ecosystems, the patterns of interactions of organisms with their environments, both living and nonliving, are shared. (MS-LS2-2)
**Disciplinary Core Idea**

**MS.LS2.C: Ecosystem Dynamics, Functioning, and Resilience**

Ecosystems are dynamic in nature; their characteristics can vary over time. Disruptions to any physical or biological component of an ecosystem can lead to shifts in all its populations. (MS-LS2-4)

**Disciplinary Core Idea**

**MS.LS2.C: Ecosystem Dynamics, Functioning, and Resilience**

Biodiversity describes the variety of species found in Earth’s terrestrial and oceanic ecosystems. The completeness or integrity of an ecosystem’s biodiversity is often used as a measure of its health. (MS-LS2-5)

**Disciplinary Core Idea**

**MS.LS4.D: Biodiversity and Humans**

Changes in biodiversity can influence humans’ resources, such as food, energy, and medicines, as well as ecosystem services that humans rely on— for example, water purification and recycling. (MS-LS2-5)
**Disciplinary Core Idea**

**MS.ETS1.B: Developing Possible Solutions**

There are systematic processes for evaluating solutions with respect to how well they meet the criteria and constraints of a problem. (MS-LS2-5)

**Performance Expectation**

**MS-ESS3-2: Analyze and interpret data on natural hazards to forecast future catastrophic events and inform the development of technologies to mitigate their effects.**

**Clarification Statement:** Emphasis is on how some natural hazards, such as volcanic eruptions and severe weather, are preceded by phenomena that allow for reliable predictions, but others, such as earthquakes, occur suddenly and with no notice, and thus are not yet predictable. Examples of natural hazards can be taken from interior processes (such as earthquakes and volcanic eruptions), surface processes (such as mass wasting and tsunamis), or severe weather events (such as hurricanes, tornadoes, and floods). Examples of data can include the locations, magnitudes, and frequencies of the natural hazards. Examples of technologies can be global (such as satellite systems to monitor hurricanes or forest fires) or local (such as building basements in tornado-prone regions or reservoirs to mitigate droughts).

**Assessment Boundary:** none

**Performance Expectation**

**MS-ESS3-3: Apply scientific principles to design a method for monitoring and minimizing a human impact on the environment.**

**Clarification Statement:** Examples of the design process include examining human environmental impacts, assessing the kinds of solutions that are feasible, and designing and evaluating solutions that could reduce that impact. Examples of human impacts can include water usage (such as the withdrawal of water from streams and aquifers or the construction of dams and levees), land usage (such as urban development, agriculture, or the removal of wetlands), and pollution (such as of the air, water, or land).

**Assessment Boundary:** none

*This performance expectation integrates traditional science content with engineering through a practice or disciplinary code idea.*
Performance Expectation

**MS-ESS3-4:** Construct an argument supported by evidence for how increases in human population and per-capita consumption of natural resources impact Earth's systems.

**Clarification Statement:** Examples of evidence include grade-appropriate databases on human populations and the rates of consumption of food and natural resources (such as freshwater, mineral, and energy). Examples of impacts can include changes to the appearance, composition, and structure of Earth's systems as well as the rates at which they change. The consequences of increases in human populations and consumption of natural resources are described by science, but science does not make the decisions for the actions society takes.

**Assessment Boundary:** none

Performance Expectation

**MS-PS3-2:** Develop a model to describe that when the arrangement of objects interacting at a distance changes, different amounts of potential energy are stored in the system.

**Clarification Statement:** Emphasis is on relative amounts of potential energy, not on calculations of potential energy. Examples of objects within systems interacting at varying distances could include: the Earth and either a roller coaster cart at varying positions on a hill or objects at varying heights on shelves, changing the direction/orientation of a magnet, and a balloon with static electrical charge being brought closer to a classmate's hair. Examples of models could include representations, diagrams, pictures, and written descriptions of systems.

**Assessment Boundary:** Assessment is limited to two objects and electric, magnetic, and gravitational interactions.

Performance Expectation

**MS-LS2-1:** Analyze and interpret data to provide evidence for the effects of resource availability on organisms and populations of organisms in an ecosystem.

**Clarification Statement:** Emphasis is on cause and effect relationships between resources and growth of individual organisms and the numbers of organisms in ecosystems during periods of abundant and scarce resources.

**Assessment Boundary:** none
Performance Expectation

**MS-LS2-2: Construct an explanation that predicts patterns of interactions among organisms across multiple ecosystems.**

**Clarification Statement:** Emphasis is on predicting consistent patterns of interactions in different ecosystems in terms of the relationships among and between organisms and abiotic components of ecosystems. Examples of types of interactions could include competitive, predatory, and mutually beneficial.

**Assessment Boundary:** none

---

Performance Expectation

**MS-LS2-4: Construct an argument supported by empirical evidence that changes to physical or biological components of an ecosystem affect populations.**

**Clarification Statement:** Emphasis is on recognizing patterns in data and making warranted inferences about changes in populations, and on evaluating empirical evidence supporting arguments about changes to ecosystems.

**Assessment Boundary:** none

---

Performance Expectation

**MS-LS2-5: Evaluate competing design solutions for maintaining biodiversity and ecosystem services.***

**Clarification Statement:** Examples of ecosystem services could include water purification, nutrient recycling, and prevention of soil erosion. Examples of design solution constraints could include scientific, economic, and social considerations.

**Assessment Boundary:** none

* This performance expectation integrates traditional science content with engineering through a practice or disciplinary code idea.
Science and Engineering Practice

Analyzing and Interpreting Data

Analyzing data in 6–8 builds on K–5 experiences and progresses to extending quantitative analysis to investigations, distinguishing between correlation and causation, and basic statistical techniques of data and error analysis.

Analyze and interpret data to determine similarities and differences in findings. (MS-ESS3-2)

Science and Engineering Practice

Constructing Explanations and Designing Solutions

Constructing explanations and designing solutions in 6–8 builds on K–5 experiences and progresses to include constructing explanations and designing solutions supported by multiple sources of evidence consistent with scientific ideas, principles, and theories.

Apply scientific ideas or principles to design an object, tool, process or system. (MS-ESS3-3)

Science and Engineering Practice

Engaging in Argument from Evidence

Engaging in argument from evidence in 6–8 builds on K–5 experiences and progresses to constructing a convincing argument that supports or refutes claims for either explanations or solutions about the natural and designed world(s).

Construct an oral and written argument supported by empirical evidence and scientific reasoning to support or refute an explanation or a model for a phenomenon or a solution to a problem. (MS-ESS3-4)
Science and Engineering Practice

Developing and Using Models
Modeling in 6–8 builds on K–5 experiences and progresses to developing, using, and revising models to describe, test, and predict more abstract phenomena and design systems.

Develop a model to describe unobservable mechanisms. (MS-PS3-2)

Science and Engineering Practice

Analyzing and Interpreting Data
Analyzing data in 6–8 builds on K–5 experiences and progresses to extending quantitative analysis to investigations, distinguishing between correlation and causation, and basic statistical techniques of data and error analysis.

Analyze and interpret data to provide evidence for phenomena. (MS-LS2-1)

Science and Engineering Practice

Constructing Explanations and Designing Solutions
Constructing explanations and designing solutions in 6–8 builds on K–5 experiences and progresses to include constructing explanations and designing solutions supported by multiple sources of evidence consistent with scientific ideas, principles, and theories.

Construct an explanation that includes qualitative or quantitative relationships between variables that predict phenomena. (MS-LS2-2)
Science and Engineering Practice

**Engaging in Argument from Evidence**

Engaging in argument from evidence in 6–8 builds on K–5 experiences and progresses to constructing a convincing argument that supports or refutes claims for either explanations or solutions about the natural and designed world(s).

**Construct an oral and written argument supported by empirical evidence and scientific reasoning to support or refute an explanation or a model for a phenomenon or a solution to a problem.** (MS-LS2-4)

Science and Engineering Practice

**Engaging in Argument from Evidence**

Engaging in argument from evidence in 6–8 builds on K–5 experiences and progresses to constructing a convincing argument that supports or refutes claims for either explanations or solutions about the natural and designed world(s).

**Evaluate competing design solutions based on jointly developed and agreed-upon design criteria.** (MS-LS2-5)

Crosscutting Concept

**Patterns**

Graphs, charts, and images can be used to identify patterns in data. (MS-ESS3-2)
**Crosscutting Concept**

**Cause and Effect**

Cause and effect relationships may be used to predict phenomena in natural or designed systems. (MS-ESS3-4)

**Crosscutting Concept**

**Cause and Effect**

Relationships can be classified as causal or correlational, and correlation does not necessarily imply causation. (MS-ESS3-3)

**Crosscutting Concept**

**Systems and System Models**

Models can be used to represent systems and their interactions—such as inputs, processes and outputs—and energy and matter flows within systems. (MS-PS3-2)
### Crosscutting Concept

**Cause and Effect**

Cause and effect relationships may be used to predict phenomena in natural or designed systems. (MS-LS2-1)

---

**Patterns**

Patterns can be used to identify cause-and-effect relationships. (MS-LS2-2)

---

**Stability and Change**

Small changes in one part of a system might cause large changes in another part. (MS-LS2-4)
Crosscutting Concept

**Stability and Change**

Small changes in one part of a system might cause large changes in another part. (MS-LS2-5)

Connection to Nature of Science

**Science Addresses Questions About the Natural and Material World**

Scientific knowledge can describe the consequences of actions but does not necessarily prescribe the decisions that society takes. (MS-ESS3-4)

Connection to Engineering, Technology, and Applications of Science

**Influence of Science, Engineering, and Technology on Society and the Natural World**

The uses of technologies and any limitations on their use are driven by individual or societal needs, desires, and values; by the findings of scientific research; and by differences in such factors as climate, natural resources, and economic conditions. Thus technology use varies from region to region and over time. (MS-ESS3-2), (MS-ESS3-3)
Influence of Science, Engineering, and Technology on Society and the Natural World

All human activity draws on natural resources and has both short and long-term consequences, positive as well as negative, for the health of people and the natural environment. (MS-ESS3-4)

Science Knowledge Is Based on Empirical Evidence

Science disciplines share common rules of obtaining and evaluating empirical evidence. (MS-LS2-4)

Science Addresses Questions About the Natural and Material World

Scientific knowledge can describe the consequences of actions but does not necessarily prescribe the decisions that society takes. (MS-LS2-5)
**Influence of Science, Engineering, and Technology on Society and the Natural World**

The uses of technologies and any limitations on their use are driven by individual or societal needs, desires, and values; by the findings of scientific research; and by differences in such factors as climate, natural resources, and economic conditions. Thus technology use varies from region to region and over time. (MS-LS2-5)

---

**Reading in Science**

**RST.6-8.1 - Key Ideas and Details**

Cite specific textual evidence to support analysis of science and technical texts. (MS-ESS3-2), (MS-ESS3-4)

---

**Reading in Science**

**RST.6-8.7 - Integration of Knowledge and Ideas**

Integrate quantitative or technical information expressed in words in a text with a version of that information expressed visually (e.g., in a flowchart, diagram, model, graph, or table). (MS-ESS3-2)

### Common Core State Standards for ELA/Literacy

**Writing in Science**

**WHST.6-8.9 - Research to Build and Present Knowledge**

Draw evidence from informational texts to support analysis reflection, and research. (MS-ESS3-3)

---

### Common Core State Standards for Mathematics

**Expressions & Equations**

**6.EE.B.6 - Reason about and solve one-variable equations and inequalities.**

Use variables to represent numbers and write expressions when solving a real-world or mathematical problem; understand that a variable can represent an unknown number, or, depending on the purpose at hand, any number in a specified set. (MS-ESS3-2), (MS-ESS3-3), (MS-ESS3-4)

---

### Common Core State Standards for Mathematics

**Ratios & Proportional Relationships**

**6.RP.A.1 - Understand ratio concepts and use ratio reasoning to solve problems.**

Understand the concept of a ratio and use ratio language to describe a ratio relationship between two quantities. (MS-ESS3-3), (MS-ESS3-4)
Expressions & Equations
7.EE.B.4 - Solve real-life and mathematical problems using numerical and algebraic expressions and equations.
Use variables to represent quantities in a real-world or mathematical problem, and construct simple equations and inequalities to solve problems by reasoning about the quantities. (MS-ESS3-2), (MS-ESS3-3), (MS-ESS3-4)

Ratios & Proportional Relationships
7.RP.A.2 - Analyze proportional relationships and use them to solve real-world and mathematical problems.
Recognize and represent proportional relationships between quantities. (MS-ESS3-3), (MS-ESS3-4)

Mathematical Practices
MP.2 - Reason abstractly and quantitatively
Reason abstractly and quantitatively. (MS-ESS3-2)
